# Embedded Systems: An Application-Centered Approach

#### Robert Dick

http://robertdick.org/esaca/ Office: 2417-E EECS Department of Electrical Engineering and Computer Science University of Michigan

#### Synthesis motivation

- Embedded systems are found everywhere: cars, houses, games, phones, hospitals, etc.
- Designers need tools to deal with increasing complexity, increase product quality, and guarantee correct operation.
- Software or hardware errors are not acceptable. Anti-lock brake systems aren't allowed to crash.
- Embedded systems should not require bug fixes or upgrades.
- Price competition can be intense.
- Power consumption should be low.

Optimization for synthesis Homework	Allocation, assignment, and scheduling Brief introduction to NP-completeness Complete optimization/search Stochastic optimization techniques
unomial time complexities	

# Polynomial time complexities

- Recall that sorting may be done in  $\mathcal{O}(n \lg n)$  time
- DFS  $\in \mathcal{O}(|V| + |E|)$ , BFS  $\in \mathcal{O}(|V|)$
- Topological sort  $\in \mathcal{O}\left(|V| + |E|\right)$

#### Optimization for synthesis Homework Complete optimization/search

#### Exponential time complexities

#### There also exist exponential-time algorithms: $\mathcal{O}(2^{\lg n}), \mathcal{O}(2^n), \mathcal{O}(3^n)$

#### Implications of exponential time complexity

For  $t(n) = 2^n$  seconds

- t(1) = 2 seconds t(10) = 17 minutes t(20) = 12 days t(50) = 35,702,052 years
- t(100) = 40, 196, 936, 841, 331, 500, 000, 000 years

Optimization for synthesis Homework	Allocation, assignment, and scheduling Brief introduction to $\mathcal{NP}$ -completeness Complete optimization/search Stochastic optimization techniques	Optimization for synthesis Homework	Allocation, assignment, and scheduling Brief introduction to $\mathcal{NP}$ -completeness Complete optimization/search Stochastic optimization techniques

<ul> <li>Digital design and synthesis is</li> <li>Graph coloring</li> <li>Allocation/assignment</li> <li>Scheduling</li> <li>Graph partitioning</li> <li>Satisfiability (and 3SAT)</li> <li>Covering</li> <li> and many more</li> </ul>	full of NP-complete problems	<ul> <li>There is a class of problems, J has found polynomial time sol</li> <li>It is possible to convert betwee time</li> <li>Thus, if it is possible to solve polynomial time, all can be so</li> <li>P ⊆ NP</li> <li>Unproven conjecture: P ≠ N</li> </ul>	$\mathcal{VP}$ -complete, for which nobody utions en these problems in polynomial any problem in $\mathcal{NP}$ -complete in lved in polynomial time $\mathcal{P}$
10 Robert Dick	Embedded Systems: An Application-Centered Approach	11 Robert Dick	Embedded Systems: An Application-Centered Approach

- $\bullet$  What is  $\mathcal{NP}?$  Nondeterministic polynomial time.
- A computer that can simultaneously follow multiple paths in a solution space exploration tree is nondeterministic. Such a computer can solve  $\mathcal{NP}$  problems in polynomial time.
- Nobody has been able to prove either

$$\mathcal{P} \neq \mathcal{NP}$$

or

$$\mathcal{P} = \mathcal{N}\mathcal{P}$$

If we define  $\mathcal{NP}$ -complete to be a set of problems in  $\mathcal{NP}$  for which any problem's instance may be converted to an instance of another problem in  $\mathcal{NP}$ -complete in polynomial time, then

 $\mathcal{P} \subsetneq \mathcal{NP} \Rightarrow \mathcal{NP}\text{-complete} \cap \mathcal{P} = \varnothing$

Optimization for synthesi

Embedded Systems: An Application-Centered Approac

Let T be a tentative solution, or tour  $\forall e \in E$  let there be a variable

$$t_e = egin{cases} 1 & ext{if } e \in T \ 0 & ext{if } e \notin T \end{cases}$$

Constraint: Given that S is a set of vertices, con(S) is the set of edges connecting  $v \in S$  to  $v \notin S$ , and  $\{v_i\}$  is the vertex set containing only  $v_i$ , every vertex,  $v_i$  must be connected to two edges of the tour

$$\forall v_i \in V, \sum_{e \in \mathsf{con}(\{v_i\})} = 2$$

<b>Optimization for synthesis</b> Homework	Allocation, assignment, and scheduling Brief introduction to $\mathcal{NP}$ -completeness Complete optimization/search Stochastic optimization techniques
Backtracking iterative improv	vement

- Allows B steps of backtracking
- Can be incomplete
- Complete if B = the problem decision depth
- Allows use of problem-speficic heuristics for ordering
- Incomplete if B < decision depth
- More on this later

Optimization for synthesis

### Optimization techniques

# Constructive algorithms

- Build solution piece by piece
- Once complete solution is generated, don't change
- Typically fast
- Easy to use problem-specific information

Optimization

for s

- Easy to implement
- Prone to becomming trapped in poor search space

Allocation, assignment, and Scheduling Optimization for synthesis Homework Stochastic optimization/search	Optimization for synthesis Homework Complete optimization techniques

	Optimization for synthesis Homework	Allocation, assignment, and scheduling Brief introduction to $\mathcal{NP}$ -completeness Complete optimization/search Stochastic ontimization techniques
Local minima		

• Even if all solutions reachable, may not get best solution

• Depends on move selection

- Backtracking iterative improvement is complete if
  - all solutions are reachable
  - ${\ensuremath{\,\circ\,}}$  the backtracking depth  $\ge$  search depth
  - ... however, this can be slow
- Even if incomplete, backtracking can improve quality

Robert Dick

Embedded Systems: An Application-Centered Approach

- Can trade optimization time for solution quality
- Greedy iterative improvement if backtracking depth is zero

Optimiza

Optimization fo

- Start from high temperature and gradually lower
- Avoids local minima traps
- Generate trial solutions
- Conduct Boltzmann trials between old and new solution

- Easy to implement
- Can trade optimization time for solutions quality
- Greedy iterative improvement if temperature is zero
- Famous for solving difficult physical problems, e.g., placement

Optimization for synthesis	Brief introduction to $\mathcal{NP}$ -completeness	Optimization for synthesis	Brief introduction to $\mathcal{NP}$ -completeness
	Complete optimization/search Stochastic optimization techniques	Homework	Complete optimization/search Stochastic optimization techniques
Roltzmann trials		Roltzmann trials	

Solution are selected for survival by conducting Boltzmann trials between parents and children.

Given a global temperature T, a solution with cost K beats a solution with cost J with probability:

$$\frac{1}{1+e^{(J-K)/T}}$$

Robert Dick

Introduce convenience variable U  $U(T) = 1 - \frac{1}{T+1}$  U(0) = 0 $T \rightarrow 1 \Rightarrow U(T) \rightarrow \infty$

### Cooling schedule often not important

Optimization for synthes

### Simulated annealing notes

Optimization

- Time complexity extremely difficult to analyze
- Given a slow enough cooling schedule, will get optimum
  - This schedule sometimes makes simulated anealing slower than exhaustive search
  - Determining optimal schedule requires detailed knowledge of problem's Markov chains

Robert Dick Embedded

Pareto-ranking	

A solution dominates another if all its costs are lower, i.e.,

 $\mathbf{dom}_{a,b} = \forall_{i=1}^{n} cost_{a,i} < cost_{b,i} \land a \neq b$ 

A solution's rank is the number of other solutions which do not dominate it, i.e.,

$$\mathsf{rank}_{s'} = \sum_{i=1}^n \mathsf{not} \ \mathsf{dom}_{s_i,s'}$$

Optimization for synthesis Homework

What to do by Wednesday evening

Send the following things to me by email

• An itemized list of 1-3 value propositions, i.e., the values you think your embedded system or research idea can provide to your customers.

Embedded Systems: An Application-Centered Approach

- A text file containing a paragraph-long description of the embedded system you are currently planning to prototype.
- A text file listing the 2-3 most important hypotheses you are attempting to validate or invalidate via interviews.
- A text file (or files) containing notes from all your interviews. You should have around 10 by Wednesday. Each should contain the following.
  - Date and time.
  - Name of interviewee.
  - Why the interviewee is a potential customer.
  - A chronologically organized series of questions and answers. These can be terse.
