#### Introduction

Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Available resources – System-level

- General-purpose SW processors
- Digital signal processors (DSPs)
- Application-specific integrated circuits
- Dynamically reconfigurable hardware
  - E.g., field-programmable gate arrays (FPGAs)
- Busses
- Wireless communication channels
- Wires

#### Introduction

Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

### Available resources – High-level

- Simple arithmetic/logic units
- Multiplexers
- Registers
- Wires

#### Introduction

Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Specification language requirements

- Describe hardware (HW) and software (SW) requirements
- Specify constraints on design
- Indicate system-level building blocks
- To allow flexibility in synthesis, must be abstract
  - Differentiate HW from SW only when necessary
  - · Concentrate on requirements, not implementation
  - Make few assumptions about platform

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Section outline

 Specification and modeling languages Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Software oriented design representations

- ANSI-C
- SystemC
- Other SW language-based

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

# ANSI-C

#### Advantages

- Huge code base
- Many experienced programmers
- Efficient means of SW implementation
- Good compilers for many SW processors

Disadvantages

- Little implementation flexibility
  - Strongly SW oriented
  - Makes many assumptions about platform
- Poor support for fine-scale HW synchronization

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

# SystemC

#### Advantages

- Support from big players
  - Synopsys, Cadence, ARM, Red Hat, Ericsson, Fujitsu, Infineon Technologies AG, Sony Corp., STMicroelectronics, and Texas Instruments
- Familiar for SW engineers

Disadvantages

- Extension of SW language
  - Not designed for HW from the start
- Compiler available for limited number of SW processors
  - New

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Other SW language-based

- Numerous competitors
- Numerous languages
  - ANSI-C, C++, and Java are most popular starting points
- In the end, few can survive
- SystemC has broad support

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Hardware oriented design representations

- VHDL
- Verilog
- Esterel

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### VHDL

#### Advantages

- Supports abstract data types
- System-level modeling supported
- Better support for test harness design

Disadvantages

- Requires extensions to easily operate at the gate-level
- Difficult to learn
- Slow to code

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

# Verilog

#### Advantages

- Easy to learn
- Easy for small designs

#### Disadvantages

- Not designed to handle large designs
- Not designed for system-level

#### Verilog vs. VHDL

- March 1995, Synopsys Users Group meeting
- Create a gate netlist for the fastest fully synchronous loadable
   9-bit increment-by-3 decrement-by-5 up/down counter that generated even parity, carry and borrow
- 5 / 9 Verilog users completed
- $\bullet~0~/~5~VHDL$  users competed

Does this mean that Verilog is better? Maybe, but maybe it only means that Verilog is easier to use for simple designs.

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Esterel

- Easily allows synchronization among parallel tasks
- Works above RTL
  - Doesn't require explicit enumeration of all states and transitions
- Recently extended for specifying datapaths and flexible clocking schemes
- Amenable to theorem proving
- Translation to RTL or C possible
- Commercialized by Esterel Technologies

Introduction Software oriented design representations Hardware oriented design representations **Graph based design representations** Resource descriptions

#### Section outline

#### 1. Specification and modeling languages

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Graph based design representations

- Dataflow graph (DFG)
- Synchronous dataflow graph (SDFG)
- Control flow graph (CFG)
- Control dataflow graph (CDFG)
- Finite state machine (FSM)
- Petri net
- Periodic vs. aperiodic
- Real-time vs. best effort
- Discrete vs. continuous timing
- Example from research

Introduction Software oriented design representations Hardware oriented design representations **Graph based design representations** Resource descriptions

# Dataflow graph (DFG)

- Nodes are tasks
- Edges are data dependencies
- Edges have communication quantities
- Used for digital signal processing (DSP)
- Often acyclic when real-time
- Can be cyclic when best-effort

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

# Control flow graph (CFG)

Introduction Software oriented design representations Hardware oriented design representations **Graph based design representations** Resource descriptions

# Control dataflow graph (CDFG)

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Finite state machine (FSM)

Introduction Software oriented design representations Hardware oriented design representations **Graph based design representations** Resource descriptions

## Finite state machine (FSM)

	input	
	0	1
00	10	00
01	01	00
10	00	01
11	10	00
current	next	

- Normally used at lower levels
- Difficult to represent independent behavior
  - State explosion
- No built-in representation for data flow
  - Extensions have been proposed
- Extensions represent SW, e.g., co-design finite state machines (CFSMs)

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

- Graph composed of places, transitions, and arcs
- Tokens are produced and consumed
- Useful model for asynchronous and stochastic processes
- Places can have priorities
- Not well-suited for representing dataflow systems
- Timing analysis quite difficult
- Large flat graphs difficult to understand

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Periodic graphs

- Some system specifications contain periodic graphs
- Can guarantee scheduling validity by scheduling to the least common multiple of periods
- Can also meet aperiodic specifications, however, resources will sometimes be idle

Introduction Software oriented design representations Hardware oriented design representations **Graph based design representations** Resource descriptions

#### Periodic graphs

Introduction Software oriented design representations Hardware oriented design representations **Graph based design representations** Resource descriptions

#### Periodic graphs

Introduction Software oriented design representations Hardware oriented design representations **Graph based design representations** Resource descriptions

#### Periodic graphs

system hyperperiod = 60 ms

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Aperiodic graphs

- No precise periods imposed on task execution
- Useful for representing reactive systems
- Difficult to guarantee hard deadlines in such systems
  - Possible if minimum inter-arrival time known

## Periodic vs. aperiodic

#### Periodic applications

- Power electronics
- Transportation applications
  - Engine controllers
  - Brake controllers
- Many multimedia applications
  - Video frame rate
  - Audio sample rate
- Many digital signal processing (DSP) applications

However, devices which react to unpredictable external stimuli have aperiodic behavior

Many applications contain periodic and aperiodic components

#### Aperiodic to periodic

Can design periodic specifications that meet requirements posed by aperiodic specifications

• Some resources will be wasted

Example:

- At most one aperiodic task can arrive every 50 ms
- It must complete execution within 100 ms of its arrival time

#### Aperiodic to periodic

- Can easily build a periodic representation with a deadline and period of 5 ms
  - Problem, requires a 50 ms execution time when 100 ms should be sufficient
- Can use overlapping graphs to allow an increase in execution time
  - Parallelism required

The main problem with representing aperiodic problems with periodic representations is that the tradeoff between deadline and period must be made at the time of synthesis

Introduction Software oriented design representations Hardware oriented design representations **Graph based design representations** Resource descriptions

#### Real-time vs. best effort

- Why make decisions about system implementation statically?
  - Allows easy timing analysis, hard real-time guarantees
- If a system doesn't have hard real-time deadlines, resources can be more efficiently used by making late, dynamic decisions
- Can combine real-time and best-effort portions within the same specification
  - Reserve time slots
  - Take advantage of slack when tasks complete sooner than their worst-case finish times

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Discrete vs. continuous timing

#### System-level: continuous

• Operations are not small integer multiples of the clock cycle

#### High-level: discrete

• Operations are small integer multiples of the clock cycle Implications:

- System-level scheduling is more complicated...
- ... however, high-level also very difficult.

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Section outline

#### 1. Specification and modeling languages

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Processing resource description

- Often table-based
- Price, area
- For each task
  - Execution time
  - Power consumption
  - Preemption cost
  - etc.
- etc.

Similar characterization for communication resources Wise to use process-based

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Communication resource description

- Can use bus-bridge based models for distributed systems
- Wireless models
- etc.
- However, in the future, it will become increasingly important to base SOC communication model on process parameters

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

## Example from research

#### Data-flow graphs

- Multirate
- Hard real-time
- Some aperiodic hard real-time tasks
- May have best-effort tasks

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### System-level representations summary

- No single representation has been decided upon
- Software-based representations becoming more popular
- System-level representations will become more important
- This is still an active area of research

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

#### Notes on clustering and partitioning

- Interdependence with architecture
- Heterogeneity's impact on partitioning
- Applications to grid computing
- Dynamic partitioning

Introduction Software oriented design representations Hardware oriented design representations Graph based design representations Resource descriptions

### Interesting future direction

#### Open problem

- Can specification be so simple for some embedded application domains that application experts who are not computer engineers easily do it?
- What HCI, compiler, and synthesis support is required?

- 1. Specification and modeling languages
- 2. Homework

#### Continue study of topics of interest

- Due before class on 16 Jan.
- Revise your 14 Jan report based on my feedback in class on Monday and into structure shown in examples on website.
- I will use this revised report to provide additional feedback.

#### Project proposals

- Due before class on 21 Jan.
- Written project proposals with clear plan for checkpoint 1 and checkpoint 2.
- Follow style in example on website.
- Clearly describe and cite closest related work.
- Identify infrastructure you will use or build upon.
- Indicate new research problems that must be solved.
- Indicate what will be completed by each of the checkpoints, and by the end of the course. Some revision of checkpoint 2 and the final results are expected.

#### Reading assignment

- Due before class on 16 Jan.
- One-paragraph written summary.
- Fang-Jing Wu, Yu-Fen Kao, and Yu-Chee Tseng. From wireless sensor networks towards cyber physical systems. *Pervasive and Mobile Computing*, 7:398–409, July 2011.

#### Upcoming lectures

- Embedded system design optimization.
- Embedded system research communities and review process.
