Department of Electrical Engineering and Computer Science  
University of Michigan

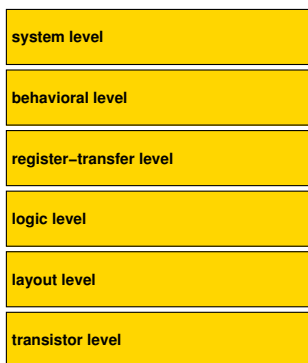

## Today's plan

Specification and modeling languages.

Comments on mini-project selection.

Example specification project.

## Short and fat vs. tall and thin

## Available resources – System-level

- General-purpose SW processors
- Digital signal processors (DSPs)
- Application-specific integrated circuits
- Dynamically reconfigurable hardware
  - E.g., field-programmable gate arrays (FPGAs)
- Busses
- Wireless communication channels
- Wires

## Available resources – High-level

- Simple arithmetic/logic units
- Multiplexers
- Registers
- Wires

## Specification language requirements

- Describe hardware (HW) and software (SW) requirements
- Specify constraints on design
- Indicate system-level building blocks
- To allow flexibility in synthesis, must be abstract
  - Differentiate HW from SW only when necessary
  - Concentrate on requirements, not implementation
  - Make few assumptions about platform

## Software oriented design representations

- ANSI-C
- SystemC
- Other SW language-based

10

Robert Dick

Interactive Distributed Embedded Systems

## ANSI-C

## Advantages

- Huge code base
- Many experienced programmers
- Efficient means of SW implementation
- Good compilers for many SW processors

## Disadvantages

- Little implementation flexibility
  - Strongly SW oriented
  - Makes many assumptions about platform
- Poor support for fine-scale HW synchronization

11

Robert Dick

Interactive Distributed Embedded Systems

## SystemC

## Advantages

- Support from big players
  - Synopsys, Cadence, ARM, Red Hat, Ericsson, Fujitsu, Infineon Technologies AG, Sony Corp., STMicroelectronics, and Texas Instruments
- Familiar for SW engineers

## Disadvantages

- Extension of SW language
  - Not designed for HW from the start
- Compiler available for limited number of SW processors
  - New

12

Robert Dick

Interactive Distributed Embedded Systems

## Other SW language-based

- Numerous competitors
- Numerous languages
  - ANSI-C, C++, and Java are most popular starting points
- In the end, few can survive
- SystemC has broad support

13

Robert Dick

Interactive Distributed Embedded Systems

## Hardware oriented design representations

- VHDL
- Verilog
- Esterel

15

Robert Dick

Interactive Distributed Embedded Systems

## VHDL

## Advantages

- Supports abstract data types
- System-level modeling supported
- Better support for test harness design

## Disadvantages

- Requires extensions to easily operate at the gate-level
- Difficult to learn
- Slow to code

16

Robert Dick

Interactive Distributed Embedded Systems

## Verilog

### Advantages

- Easy to learn
- Easy for small designs

### Disadvantages

- Not designed to handle large designs
- Not designed for system-level

17

Robert Dick

Interactive Distributed Embedded Systems

## Verilog vs. VHDL

- March 1995, Synopsys Users Group meeting
- Create a gate netlist for the fastest fully synchronous loadable 9-bit increment-by-3 decrement-by-5 up/down counter that generated even parity, carry and borrow
- 5 / 9 Verilog users completed
- 0 / 5 VHDL users completed

Does this mean that Verilog is better?

Maybe, but maybe it only means that Verilog is easier to use for simple designs.

18

Robert Dick

Interactive Distributed Embedded Systems

## Esterel

- Easily allows synchronization among parallel tasks
- Works above RTL
  - Doesn't require explicit enumeration of all states and transitions
- Recently extended for specifying datapaths and flexible clocking schemes
- Amenable to theorem proving
- Translation to RTL or C possible
- Commercialized by Esterel Technologies

19

Robert Dick

Interactive Distributed Embedded Systems

## Graph based design representations

- Dataflow graph (DFG)
- Synchronous dataflow graph (SDFG)
- Control flow graph (CFG)
- Control dataflow graph (CDFG)
- Finite state machine (FSM)
- Petri net
- Periodic vs. aperiodic
- Real-time vs. best effort
- Discrete vs. continuous timing
- Example from research

21

Robert Dick

Interactive Distributed Embedded Systems

## Dataflow graph (DFG)

- Nodes are tasks
- Edges are data dependencies
- Edges have communication quantities
- Used for digital signal processing (DSP)
- Often acyclic when real-time
- Can be cyclic when best-effort

22

Robert Dick

Interactive Distributed Embedded Systems

## Synchronous dataflow graph (SDFG)

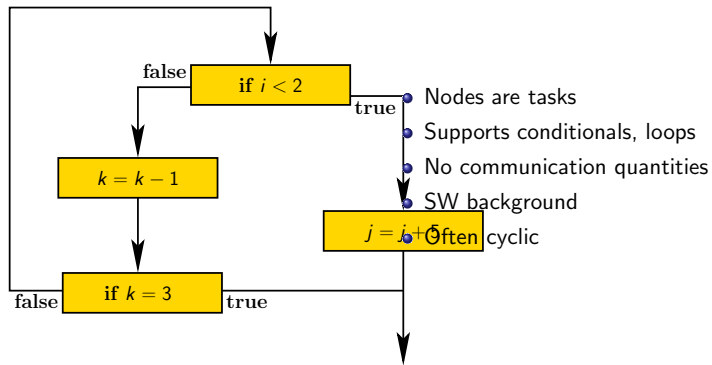

23

Robert Dick

Interactive Distributed Embedded Systems

## Control flow graph (CFG)

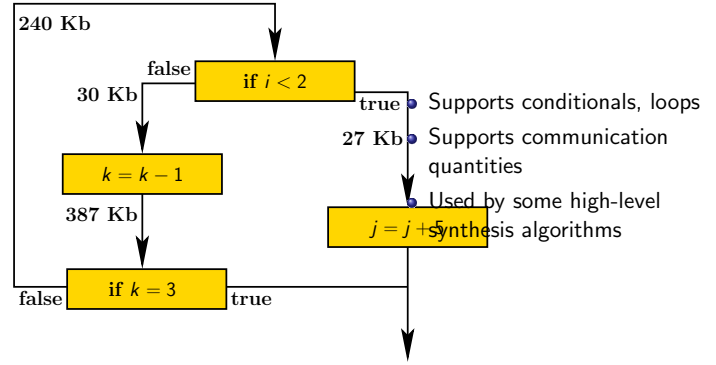

24

Robert Dick

Interactive Distributed Embedded Systems

## Control dataflow graph (CDFG)

25

Robert Dick

Interactive Distributed Embedded Systems

## Finite state machine (FSM)

26

Robert Dick

Interactive Distributed Embedded Systems

## Finite state machine (FSM)

|         | input |    |
|---------|-------|----|
|         | 0     | 1  |
| 00      | 10    | 00 |
| 01      | 01    | 00 |
| 10      | 00    | 01 |
| 11      | 10    | 00 |
| current | next  |    |

- Normally used at lower levels
- Difficult to represent independent behavior
  - State explosion
- No built-in representation for data flow
  - Extensions have been proposed
- Extensions represent SW, e.g., co-design finite state machines (CFSMs)

27

Robert Dick

Interactive Distributed Embedded Systems

## Petri net

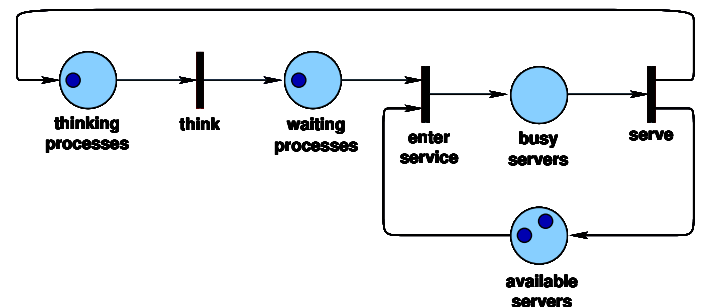

- Graph composed of places, transitions, and arcs
- Tokens are produced and consumed
- Useful model for asynchronous and stochastic processes
- Places can have priorities
- Not well-suited for representing dataflow systems
- Timing analysis quite difficult
- Large flat graphs difficult to understand

28

Robert Dick

Interactive Distributed Embedded Systems

## Petri net

M/D/3/2: Markov arrival, deterministic service delay,  
From A. Zimmermann's token game demonstration.

29

Robert Dick

Interactive Distributed Embedded Systems

## Periodic graphs

- Some system specifications contain periodic graphs
- Can guarantee scheduling validity by scheduling to the least common multiple of periods
- Can also meet aperiodic specifications, however, resources will sometimes be idle

30

Robert Dick

Interactive Distributed Embedded Systems

## Periodic graphs

31

Robert Dick

Interactive Distributed Embedded Systems

## Aperiodic graphs

- No precise periods imposed on task execution
- Useful for representing reactive systems
- Difficult to guarantee hard deadlines in such systems
  - Possible if minimum inter-arrival time known

32

Robert Dick

Interactive Distributed Embedded Systems

## Periodic vs. aperiodic

### Periodic applications

- Power electronics
  - Engine controllers
  - Brake controllers
- Many multimedia applications
  - Video frame rate
  - Audio sample rate
- Many digital signal processing (DSP) applications

However, devices which react to unpredictable external stimuli have aperiodic behavior

Many applications contain periodic and aperiodic components

33

Robert Dick

Interactive Distributed Embedded Systems

## Aperiodic to periodic

Can design periodic specifications that meet requirements posed by aperiodic specifications

- Some resources will be wasted

Example:

- At most one aperiodic task can arrive every 50 ms
- It must complete execution within 100 ms of its arrival time

34

Robert Dick

Interactive Distributed Embedded Systems

## Aperiodic to periodic

- Can easily build a periodic representation with a deadline and period of 5 ms
  - Problem, requires a 50 ms execution time when 100 ms should be sufficient
- Can use overlapping graphs to allow an increase in execution time
  - Parallelism required

The main problem with representing aperiodic problems with periodic representations is that the tradeoff between deadline and period must be made at the time of synthesis

35

Robert Dick

Interactive Distributed Embedded Systems

## Real-time vs. best effort

- Why make decisions about system implementation statically?
  - Allows easy timing analysis, hard real-time guarantees
- If a system doesn't have hard real-time deadlines, resources can be more efficiently used by making late, dynamic decisions
- Can combine real-time and best-effort portions within the same specification
  - Reserve time slots
  - Take advantage of slack when tasks complete sooner than their worst-case finish times

36

Robert Dick

Interactive Distributed Embedded Systems

## Discrete vs. continuous timing

- System-level: continuous
  - Operations are not small integer multiples of the clock cycle
- High-level: discrete
  - Operations are small integer multiples of the clock cycle
- Implications:
  - System-level scheduling is more complicated. . .
  - . . . however, high-level also very difficult.

37

Robert Dick

Interactive Distributed Embedded Systems

## Processing resource description

- Often table-based
- Price, area
- For each task
  - Execution time
  - Power consumption
  - Preemption cost
  - etc.
- etc.

Similar characterization for communication resources  
Wise to use process-based

39

Robert Dick

Interactive Distributed Embedded Systems

## Communication resource description

- Can use bus-bridge based models for distributed systems
- Wireless models
- etc.
- However, in the future, it will become increasingly important to base SOC communication model on process parameters

40

Robert Dick

Interactive Distributed Embedded Systems

## Example from research

Data-flow graphs

- Multirate
- Hard real-time
- Some aperiodic hard real-time tasks
- May have best-effort tasks

41

Robert Dick

Interactive Distributed Embedded Systems

## System-level representations summary

- No single representation has been decided upon
- Software-based representations becoming more popular
- System-level representations will become more important
- This is still an active area of research

42

Robert Dick

Interactive Distributed Embedded Systems

## Notes on clustering and partitioning

- Interdependence with architecture
- Heterogeneity's impact on partitioning
- Applications to grid computing
- Dynamic partitioning

43

Robert Dick

Interactive Distributed Embedded Systems

## Continue study of topics of interest

- Due before class on 16 Jan.
- Revise your 14 Jan report based on my feedback in class on Monday and into structure shown in examples on website.
- I will use this revised report to provide additional feedback.

46

Robert Dick

Interactive Distributed Embedded Systems

## Reading assignment

- Due before class on 16 Jan.
- One-paragraph written summary.
- Fang-Jing Wu, Yu-Fen Kao, and Yu-Chee Tseng. From wireless sensor networks towards cyber physical systems. *Pervasive and Mobile Computing*, 7:398–409, July 2011.

48

Robert Dick

Interactive Distributed Embedded Systems

## Interesting future direction

## Open problem

- Can specification be so simple for some embedded application domains that application experts who are not computer engineers easily do it?
- What HCI, compiler, and synthesis support is required?

44

Robert Dick

Interactive Distributed Embedded Systems

## Project proposals

- Due before class on 21 Jan.
- Written project proposals with clear plan for checkpoint 1 and checkpoint 2.
- Follow style in example on website.
- Clearly describe and cite closest related work.
- Identify infrastructure you will use or build upon.
- Indicate new research problems that must be solved.
- Indicate what will be completed by each of the checkpoints, and by the end of the course. Some revision of checkpoint 2 and the final results are expected.

47

Robert Dick

Interactive Distributed Embedded Systems

## Upcoming lectures

- Embedded system design optimization.
- Embedded system research communities and review process.
